

A flexible Port Conveying Solution that pays for itself!

The ICS provides a cost effective alternative conveying solution for port in-loading and out-loading applications for today's global port requirements.

Innovative Conveying Systems International (ICSI) designs and manufactures a patented, flexible enclosed belt conveying system. The Innovative Conveying System (ICS) can convey a wide range of materials including grain, woodchips, metal concentrates, coal and iron ore at varying rates.

The unique design capabilities of the ICS allow it to be easily integrated within existing port infrastructure, minimising installation and set-up costs. An automated stockpiling capability along with its ability to convey over long distances, at steep angles (up to 80°) and through tight radius vertical and horizontal curves, eliminates transfer points, product loss and addresses dust and other OH&S issues.

For more information about the ICS call us on 08 9353 2400 or visit our website today.
